# class 9 structural bioinformatics (pt 1)

Trinity Leahy

## PDB Statistics

I am going to download a CSV file from the PDB site and move it into my R studio.

```
db <- read.csv("Data Export Summary.csv")
db
```

```
           Molecular.Type   X.ray     EM    NMR Multiple.methods Neutron Other
1          Protein (only) 154,766 10,155 12,187              191      72    32
2 Protein/Oligosaccharide   9,083  1,802     32                7       1     0
3              Protein/NA   8,110  3,176    283                6       0     0
4     Nucleic acid (only)   2,664     94  1,450               12       2     1
5                   Other     163      9     32                0       0     0
6  Oligosaccharide (only)      11      0      6                1       0     4
    Total
1 177,403
2  10,925
3  11,575
4   4,223
5     204
6      22
```

> Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

First I created a function so that I can convert my string of numbers with a comma for each column into characters without a comma that R can read as a numeric value and then add them together.

```
# I will work with `x` as input.
```

```
convertandsum <- function(x){
  #Substitute the comma and convert it into a number
  sum(as.numeric(gsub(",", "", x)))
}
```

For Xray:

```
round(convertandsum(db$X.ray)/convertandsum(db$Total), 2)
```

```
[1] 0.86
```

For Electron Microscopy:

```
round(convertandsum(db$EM)/convertandsum(db$Total), 2)
```

```
[1] 0.07
```

> Q2: What proportion of structures in the PDB are protein?

```
round(convertandsum(db$Total[1])/convertandsum(db$Total), 2)
```

```
[1] 0.87
```

> Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

Skipped!

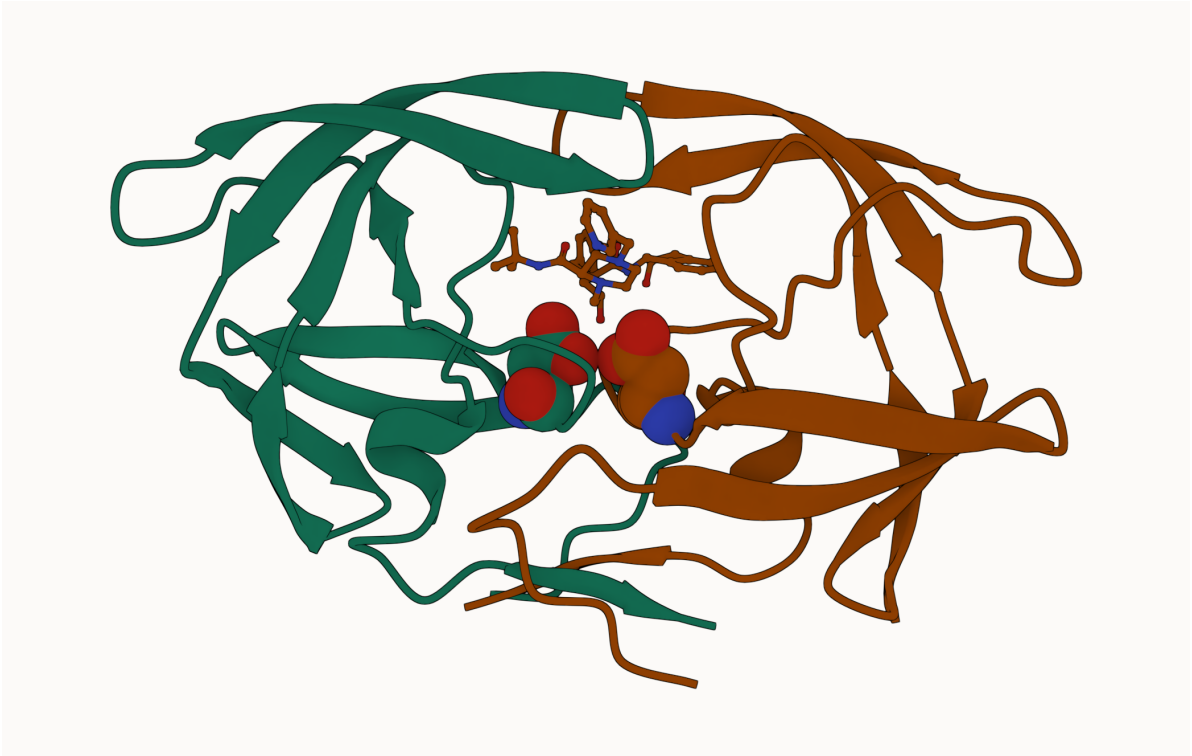
> Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

The structure is too low resolution to see H atoms. You need a sub 1 angstrom resolution to see hydrogen.

> Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

Yes, it is HOH308.

> Q6: Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain and the critical water (we recommend "Ball & Stick" for these side-chains). Add this figure to your Quarto document.



## Working with Structures in R

We can use the `bio3d` package to read and perform bioinformatics calculations on PDB structures.

```
library(bio3d)

pdb <- read.pdb("1HSG")
```

```
 Note: Accessing on-line PDB file
```

```
pdb
```

```
Call:  read.pdb(file = "1HSG")

  Total Models#: 1
```

```
     Total Atoms#: 1686,  XYZs#: 5058  Chains#: 2  (values: A B)

     Protein Atoms#: 1514  (residues/Calpha atoms#: 198)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

     Non-protein/nucleic Atoms#: 172  (residues: 128)
     Non-protein/nucleic resid values: [ HOH (127), MK1 (1) ]

   Protein sequence:
      PQITLWQRPLVTIKIGGQLKEALLDTGADDTVLEEMSLPGRWKPKMIGGIGGFIKVRQYD

      VNIIGRNLLTQIGCTLNF

+ attr: atom, xyz, seqres, helix, sheet,
        calpha, remark, call
```

```
attributes(pdb)
```

```
$names
[1] "atom"   "xyz"    "seqres" "helix"  "sheet"  "calpha" "remark" "call"

$class
[1] "pdb" "sse"
```

Q7: How many amino acid residues are there in this pdb object?

198 amino acid residues

Q8: Name one of the two non-protein residues?

MK1

Q9: How many protein chains are in this structure?

2 chains

```
head(pdb$atom)
```

```

```

Read an ADK structure

```
adk <- read.pdb("6s36")
```

```
  Note: Accessing on-line PDB file
   PDB has ALT records, taking A only, rm.alt=TRUE
```

```
adk
```

```
 Call:  read.pdb(file = "6s36")
